PRODUCT REQUIREMENTS DOCUMENT

WorkRadar: A Prioritised Work Radar for Startup Product Managers

Consolidating Slack, Jira, GitHub, Gmail and Google Calendar into one ranked daily view

Author	Gopi Krishna	**Program**	AI Product Management (AIPM), AIR Tribe — Cohort 40
Version	3.0 (Final, MVP built)	**Date**	27 October 2026
Status	Final — MVP live	**Product type**	B2B SaaS web application

1 EXECUTIVE SUMMARY

Product managers in startups spend one to two hours a day searching five tools for the few items that need their attention. WorkRadar reads only what is addressed to the PM, ranks it with a transparent score, and links to the exact source message. It aggregates existing tools and does not replace them. The MVP tests one hypothesis: **a ranked, explainable radar brings a PM to daily clarity in under five minutes.**

Vision: no product manager misses what matters because work is spread across tools. **Mission:** bring every ask, blocker, approval, meeting request and escalation into one prioritised list that leads straight back to the source.

2 PROBLEM STATEMENT

A PM in a 50-person startup coordinates with between 5 and 50 people a day. Items that need the PM — a blocked engineer, a founder's approval, a production incident, a meeting request — arrive across Slack, Jira, GitHub, Gmail and Calendar, buried in noise, unranked and often found late. Each morning the PM must answer four questions unaided: **What is my top work today? What happened? What needs immediate attention? Who is blocked?** Workers receive about 117 emails and 153 chat messages and face 275 interruptions per working day[1], and switch between applications about 1,200 times a day[2].

3 TARGET USERS

Role	Description	Relationship to the product
Customer	Software startups of 10–50 people (expansion: 50–250)	Business that adopts and pays
Primary user	One product manager per startup	Uses WorkRadar daily
Economic buyer	Founder or CTO	Approves budget and access
Gatekeeper	Workspace administrator	Grants read-only integrations
Indirect users	Approximately 50 teammates	Their messages are inputs; no login or new tool required

4 USER PERSONAS

Persona	Context	Goals	Frustrations
Priya, Product Manager (primary user)	50-person B2B SaaS startup, Bengaluru; works with 25 engineers, 4 designers, sales, support and 2 founders	Know her top three priorities by 9:30; unblock teammates the same day; finish the day with priorities closed	Requests buried in channels; blockers heard at stand-up; meeting requests spread across three tools
Arun, Co-founder and CTO (buyer)	Owns tool budget and security approval	Faster delivery and no missed escalations without extra process	No visibility of what is stuck without asking; concerned about data access

5 USER JOURNEY

Stage	Current state (without WorkRadar)	Future state (with WorkRadar)
09:00 Start	Opens five tools and scrolls for over an hour	Opens the Today view: four-line brief, top five ranked items, completion at 0%
09:10 Triage	Estimates priority from unread counts	Sees P1, P2 and P3 bands with a stated reason; filters by blockers, approvals or meetings
09:15 Act	Searches each tool for the relevant message	Opens the exact message in one click; marks Done, Snoozes or Assigns with undo
Midday	Meeting requests scattered; checks calendar separately	Sees meeting requests beside free calendar slots and copies a slot into the reply
18:00 Close	Unsure what remains open	Completion at 82% (green); two items carried to the next day

6 KEY PAIN POINTS

1. **Low signal-to-noise:** relevant items are a small share of hundreds of daily messages and notifications.
2. **No shared priority or ownership:** each tool sorts by time; status sits in Jira while blockers are raised in Slack.
3. **Late detection:** blockers and escalations surface at stand-up or when someone follows up.
4. **Fragmented scheduling:** meeting requests arrive in three tools while availability lives in the calendar.
5. **Context switching:** every action requires locating the message again in its source tool.

7 COMPETITIVE LANDSCAPE

Alternative	Strengths	Gap addressed by WorkRadar
Slack AI	Channel recaps, thread summaries, search answers	Limited to Slack; no Jira status, pull-request reviews or email escalations; higher tiers only
Atlassian Rovo	AI search and agents across Jira, Confluence and connected apps	A search tool rather than a ranked daily view; Atlassian-centred
Manual process	Notes, starred items, stand-ups, reminders	Slow and error-prone; blockers found a day late

Positioning: a vendor-neutral, PM-focused daily triage layer that ranks by urgency with a visible reason and returns the PM to the right tool to act.

8 OBJECTIVES AND SUCCESS METRICS

Objectives: O1 daily clarity within minutes · O2 no missed priorities · O3 trust without additional effort. Key results are the targets below.

Metric type	Definition	MVP target
North Star	Time to daily clarity: from opening WorkRadar to naming the top three priorities	Under 5 minutes (baseline 60+)
Daily outcome	Daily completion = items closed (Done, Assigned or Scheduled) ÷ P1 and P2 items due today. Green ≥ 80%, amber 50–79%, red below 50%	≥ 80% on 4 of 5 days
Leading	P1 items opened within two hours; share of items actioned; share of blockers raised with the @pm blocker tag	Above 70%; above 60%; above 40% by week 4
Lagging	Self-reported triage time; median time a blocker waits for the PM	50% reduction vs baseline
Guardrail	Missed-P1 rate; false-P1 rate; time spent in WorkRadar; privacy complaints	<5%; <15%; ≤20 min; zero

9 MVP SCOPE

In scope	Out of scope (later releases)	Non-goals
One PM, one 50-person startup; mock data modelled on real API events (50 people, ~45 items, 5 sources); ranking; AI brief and notes with fallback; local actions; public web app	Live OAuth connectors (V2); write-back to Jira and GitHub (V2); suggested meeting slots in replies (V2); conversational search, learned ranking and multi-PM views (V3)	Reading entire channels or inboxes; rebuilding chat, boards or code review; replying from WorkRadar; a new tool for teammates

10 FEATURES: MUST-HAVE AND NICE-TO-HAVE

Must-have (MVP)	Nice-to-have (post-MVP)
1. **Today dashboard:** four-line AI brief, completion indicator, top five ranked items 2. **Ranked radar:** band, type, short extract, ranking reason, exact-message link 3. **Type filters** with counts: blockers, escalations, approvals, requests, meetings 4. **Blocked panel**; **calendar** with meeting dots, hover details and free slots 5. **Item detail panel:** score components, AI notes, people, timeline, links 6. **Actions:** Done, Snooze, Assign with undo; **Activity Log** with restore 7. **Search**, **Team** health view and 24-hour **What Happened** feed 8. **States and themes:** sync failure, AI fallback; light, dark, system	1. Live read-only connectors for all five sources 2. Write-back of Assign and Done to Jira and GitHub 3. Suggested meeting slot inserted into replies 4. Slack bot confirmation; morning digest 5. Cross-tool de-duplication of related items 6. Conversational search; personalised ranking; multi-PM views

11 USER STORIES AND ACCEPTANCE CRITERIA

ID	User story (as the PM, I want to…)	Acceptance criteria
US1	See my top priorities when I open the application	Today view loads in under one second; items are sorted by score and show band, type, extract, reason and source
US2	Know who is blocked and on what	Every blocker (tagged, Jira status Blocked, or AI-confirmed) appears with days waiting and a working link
US3	Act without losing context	Done, Snooze and Assign update the list, counts and completion immediately; undo restores within ten seconds
US4	Handle meeting requests quickly	Each meeting request shows the next free slot from today's calendar; one click copies it and opens the request
US5	Rely on the product when a component fails	Source failure shows a stale-data notice with retry; AI failure shows counts instead of an empty brief

12 SOLUTION OVERVIEW

Component	Specification
Signal mapping	Twenty defined signals become items (e.g. Jira Blocked → Blocker; review request → Approval; invitation → Meeting). Tags **@pm blocker**, **@pm decision**, **@pm sync** override other rules; all other activity is counted, not listed.
Ranking	**Score = min(100, Type + Urgency + Sender + Waiting time + Impact)**. **P1** ≥ 70; **P2** 40–69; **P3** below 40. The two largest components form the displayed reason.
AI and privacy	AI classifies untagged items (low confidence capped at P2) and writes the brief and notes. Only PM-addressed items are read; no message bodies stored; read-only scopes.

13 ASSUMPTIONS

1. PMs trust a ranking when each item states its reason and links to the original.
2. Teams adopt three @pm tags because they result in faster responses.
3. A 50-person startup generates 10–60 PM-relevant items a day (designed for 60), and read-only APIs suffice for V2.

14 RISKS AND MITIGATIONS

Risk	Mitigation
Inaccurate ranking reduces trust	Visible score components; user feedback; guardrail metrics
Low adoption of team tags	Structured signals still apply; confirmation bot in V2
API limits (Slack 2025 policy; Gmail restricted scope)	Internal app for pilots; webhooks first; Google verification planned
Privacy concerns	PM-addressed scope; no stored bodies; channel exclusions

15 RELEASE PLAN

Release	Scope	Exit criteria
MVP	One PM with mock data: radar, brief, actions, search; usability testing with five PMs	SUS ≥ 75; task success ≥ 90%
V2 (pilot)	One startup on live read-only data; write-back, slot suggestions, bot confirmation, digest	Time to clarity < 5 min; missed-P1 < 5%
V3 (scale)	50–250-person teams; multi-PM and founder views; learned ranking; Microsoft Teams and Outlook	Paying teams retained for 3 months
